

# Immediate milk secretion stopping action

## UDDER STOPMILK

Full natural herbal-based food supplement

### RISKS OF BAD DRYING OFF PROCESS

- Udder oedema, hard quarter
- Increase of intra-mammary infection and mastitis susceptibility
- High SCC during the next lactation

### UDDER STOPMILK FEATURES

- Full natural herbal-based product mainly made of parsley, meadowsweet, thyme and horseradish
- Immediate milk-secretion stopping action
- Enables the cow's udder to regenerate secretor tissue properly
- Ensures absence of residual milk and decreases intra-mammary infection risks

### DRY COW MANAGEMENT

A proper dry-off process enables highest milking yield for the next lactation. The recommended dry period duration is between 45-60 days before calving and the drying off must consists in stopping milking the cow abruptly.

**In addition to the usual dry-off protocol, a 250ml of STOPMILK intake helps the cow to drastically reduce milk secretion (50ml for sheeps and goats).**

With no residual milk inside the udder, STOMILK prevents the dry period from risks of mastitis and allows optimal milking for the next lactation.

Reference	Designation	Pack.
M4RDUDSM	Udder Stopmilk	1x1 L
